

# Multiscale karst sediment dynamic study: from the flood scale to the pluriannual scale.

## Example with Bruisseresse spring, Normandy, France

# INTRODUCTION

- **Karstification processes => void formations:**
  - **Connected voids, fluid circulation (water, air) and sediments**
  - **Sediment traps (erosion, transport and particule sedimentation)**
  
- **Study of karst sediment provides some informations of:**
  - **Cave genesis and evolution**
  - **Hydrodynamism (sedimentation settlement and flow velocity)**
  - **...**
  
- **Upper Normandy :**
  - **≈ 100 % tap water => chalk mixed aquifer (karstified)**
  - **Sediment transported into the karst: one of the micribiological and chemical contaminatiuon sources of drinking water**
    - **Applied interest to study sediment and it transfert conditions**

# GEOMORPHO-KARSTIC CONTEXT OF THE CHALKY WESTERN PARIS BASSIN

- **Karst uncovered according to the  
Nicod [1992, 1995] classification:**

**Surface  
formations**

**Karstified  
substratum**

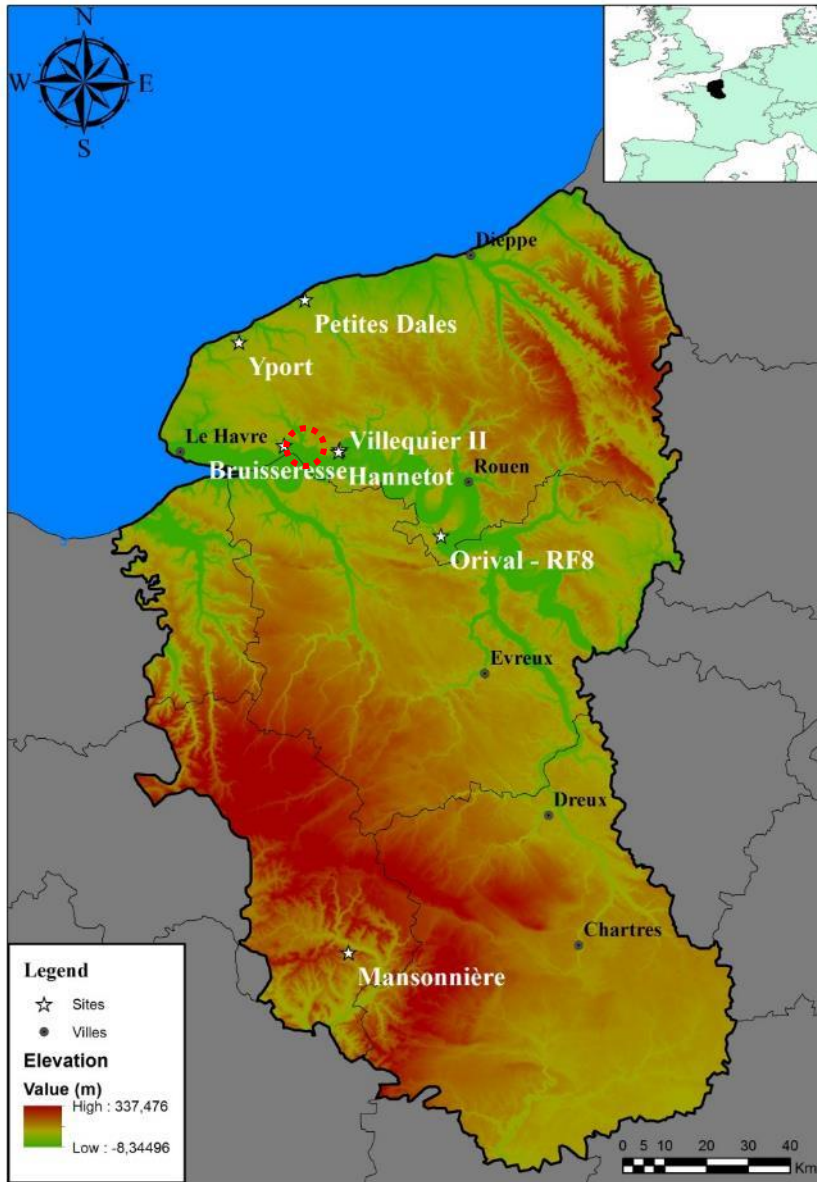

# PROBLEMATIC

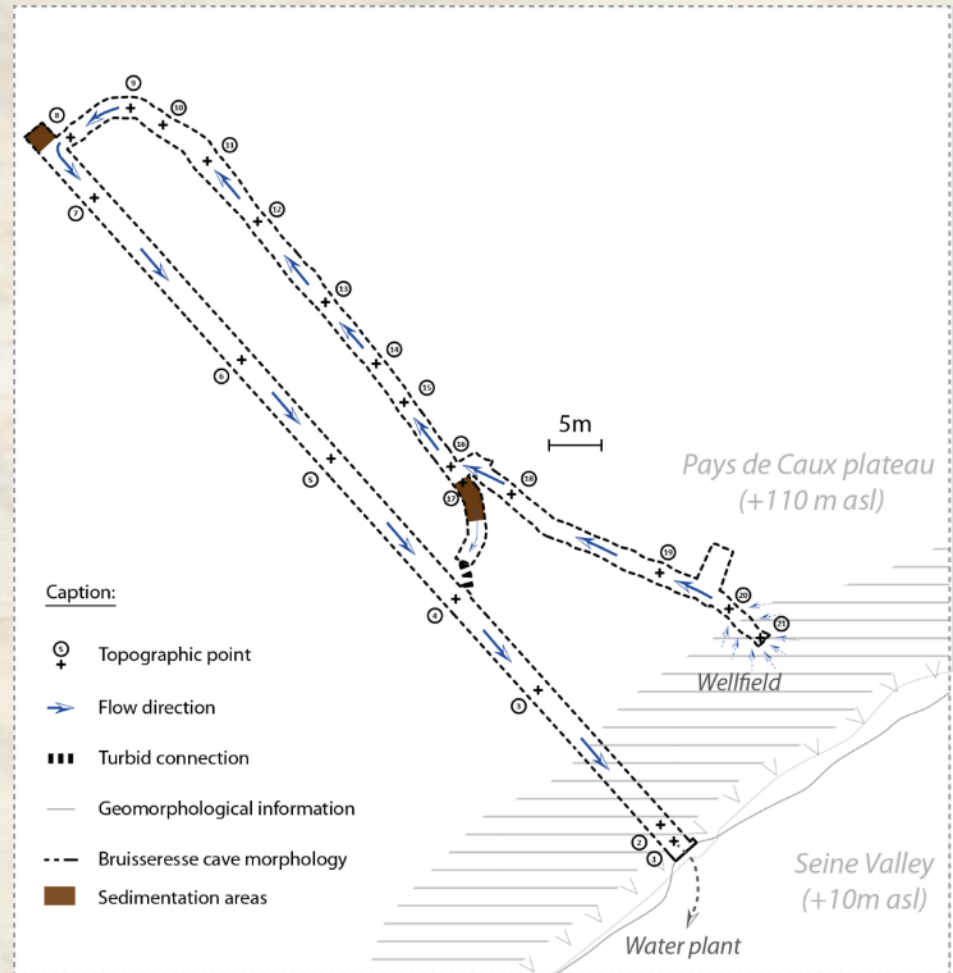

## ➤ Conditions of the transfer and sediment deposition in karst chalk?

# APPROACHES AND METHODOLOGIES

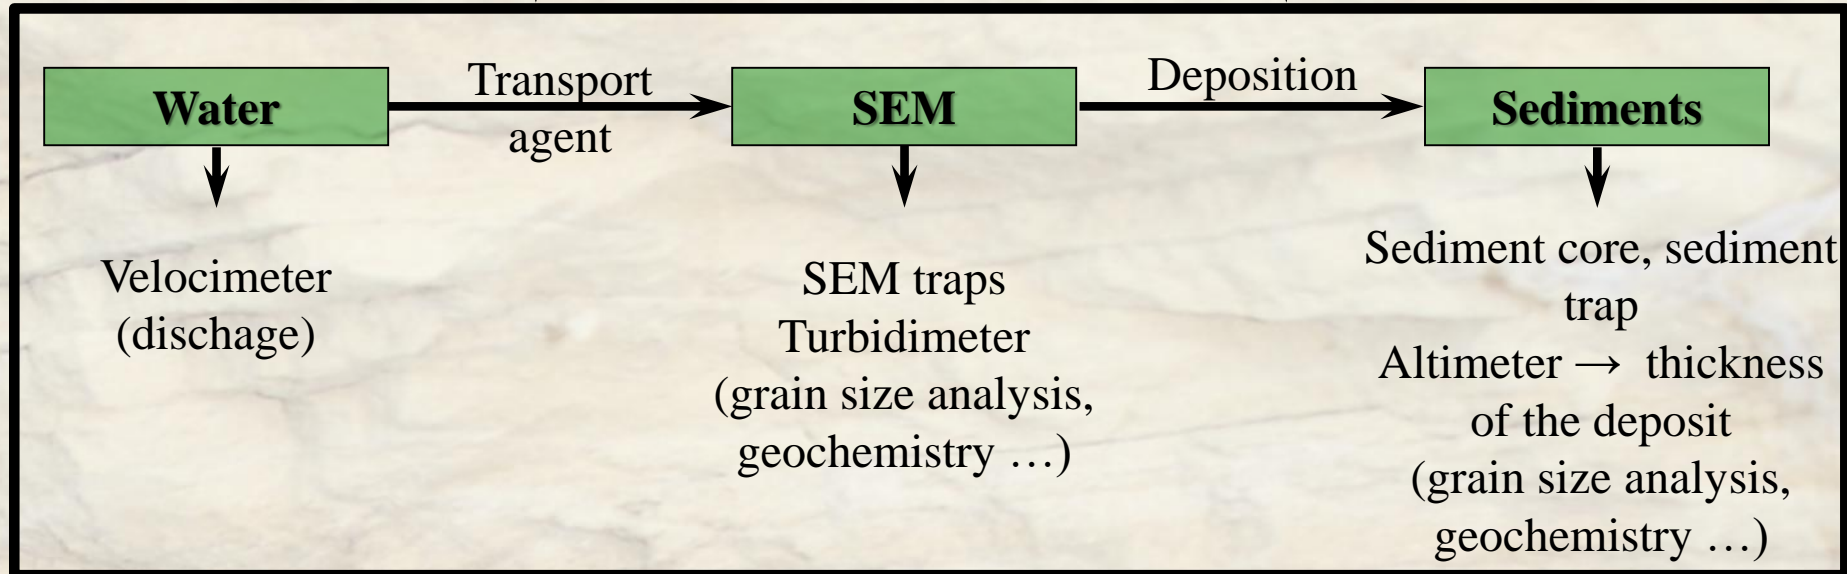

## ➤ Bruisseresse karst spring:

# APPROACHES AND METHODOLOGIES

**Sensor used (with the CODAH collaboration)**

**Crossing variables together**

**Identification of deposition, transport and erosion phases according to hydro-climatic conditions**

**Conditions of the transport, deposition and erosion of sediments in karst context**

➤ **Sedimentary variability from the small scale  
(flood event scale to the annual scale)**

➤ **Bruisseresse spring (with the CODAH collaboration)**

# SMALL SCALE SEDIMENT VARIABILITY

## ➤ Bruisseresse spring: a well field

Key :

- Sediment trap
- Altimeter: Altus
- Velocimeter
- Sedimentation areas with stake stations
- ⊕ Water catchment iron pipe

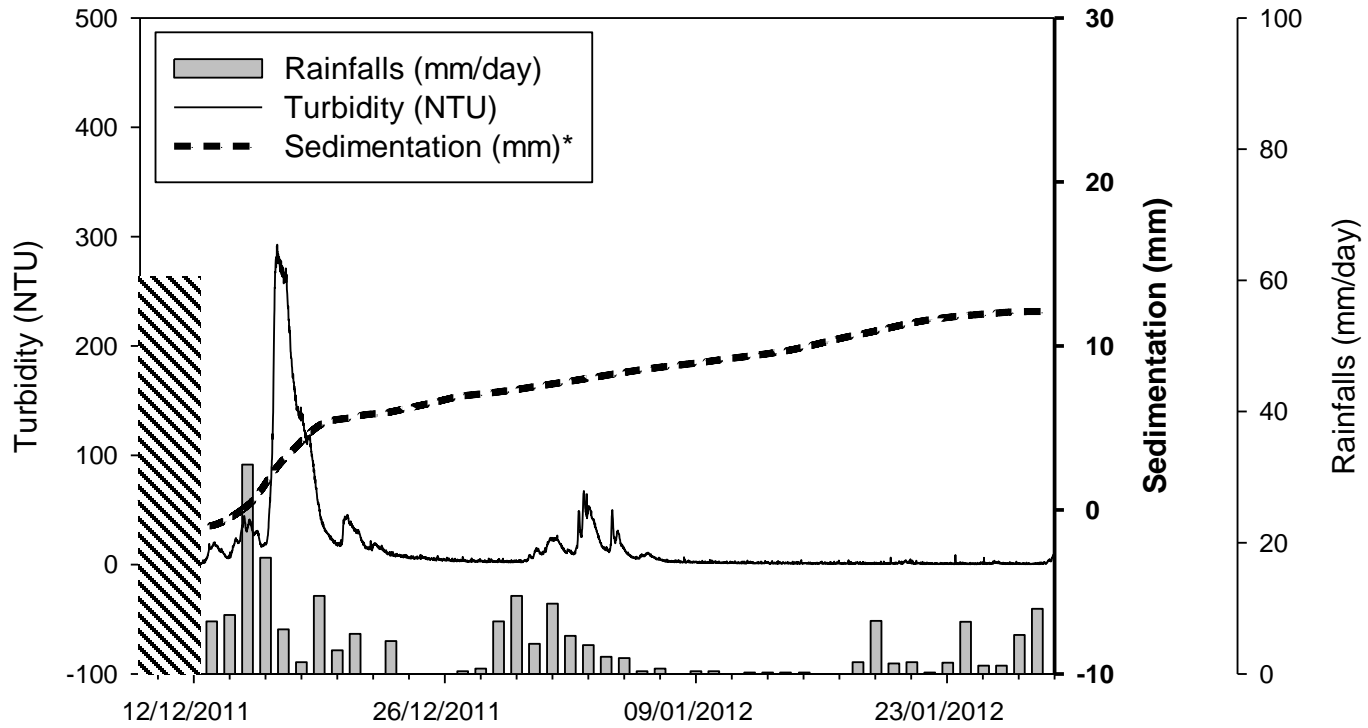

# SMALL SCALE SEDIMENT VARIABILITY

# SMALL SCALE SEDIMENT VARIABILITY

## ➤ Altimetric and hydro-sedimentary variables:

### December 2011 flood event

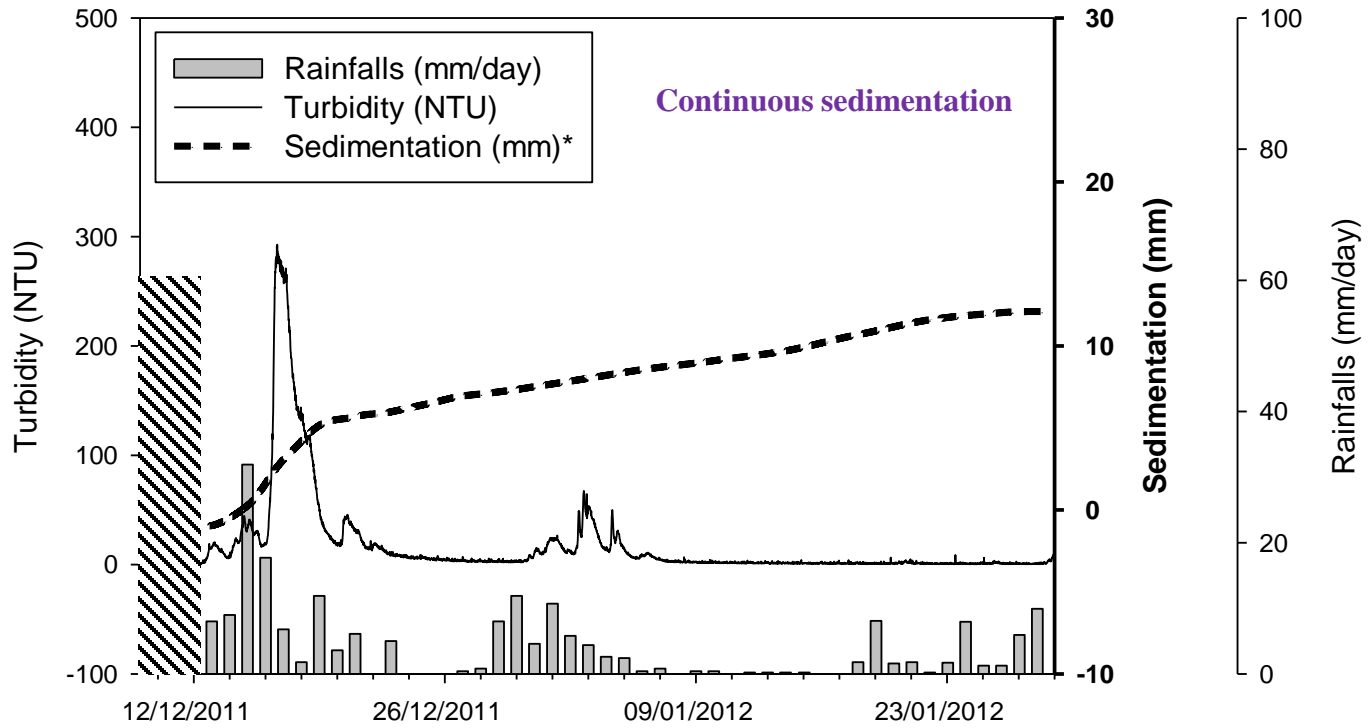

\* Smoothed data in order to delete noise device sensors (use of polynomial smooth)

# SMALL SCALE SEDIMENT VARIABILITY

## ➤ Altimetric and hydro-sedimentary variables:

### December 2011 flood event

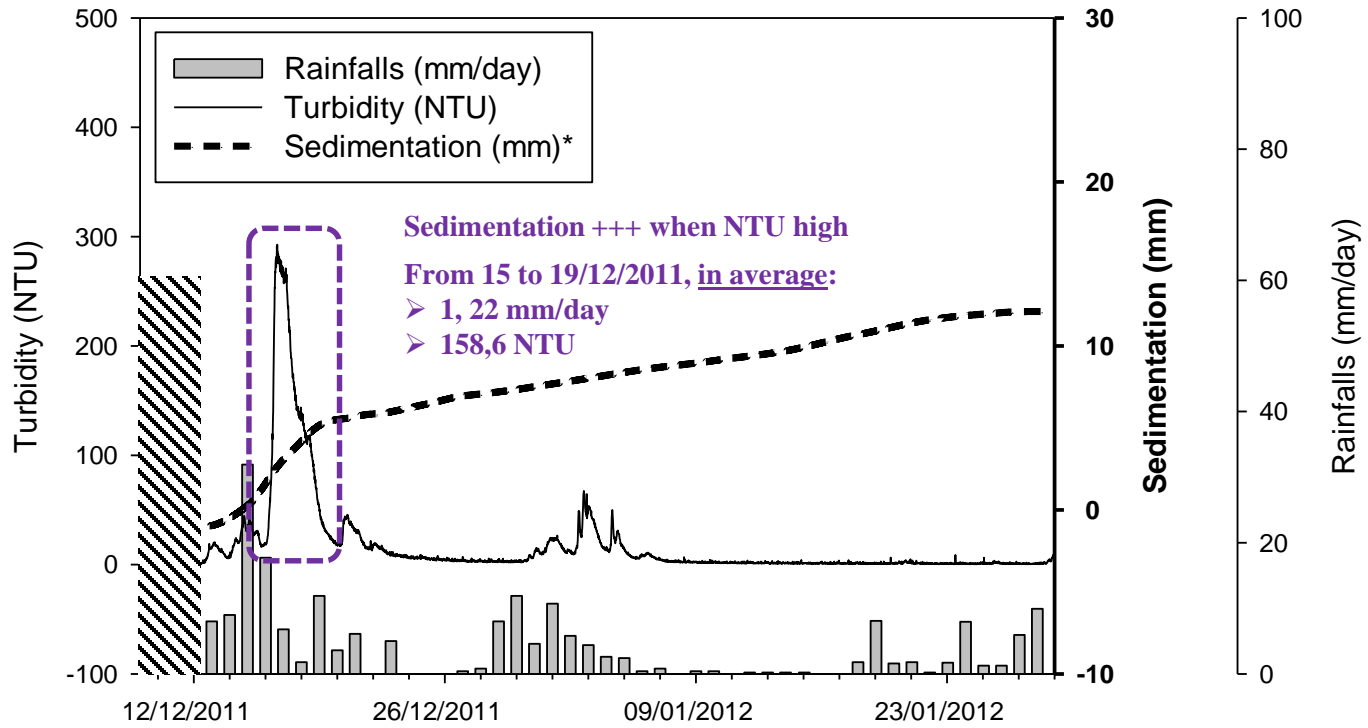

\* Smoothed data in order to delete noise device sensors (use of polynomial smooth)

Sedimentary signal: **Impulse response** + **trend response**

# SMALL SCALE SEDIMENT VARIABILITY

## ➤ Altimetric and hydro-sedimentary variables:

### December 2011 flood event

**Sedimentary signal:**      **Impulse response**      +      **trend response**

Tank effect  
Bruisseresse

Both transfert and storage sediment  
from the upstream

Both direct transport and remobilization  
from the upstream

# SMALL SCALE SEDIMENT VARIABILITY

Turbidity (NTU)

➤ Relationship between sediment and hydro-sedimentary variables:

Core (C40) done right under the altimeter

Thanks to the altimetric data :

=> Sediment filling dating at ultra high resolution

=> Fixing the turbidity curve on the core

# SMALL SCALE SEDIMENT VARIABILITY

Turbidity (NTU)

➤ Relationship between sediment and hydro-sedimentary variables:

Sandy level (42 NTU)

Sandy level (170 NTU)

Sandy level (374 NTU)

Sandy level (292 NTU)

# SMALL SCALE SEDIMENT VARIABILITY

Turbidity (NTU)

➤ Relationship between sediment and hydro-sedimentary variables:

Sandy level (42 NTU)

Alternating deposit (< 10 NTU)

Sandy level (170 NTU)

Alternating deposit (< 80 NTU)

Sandy level (374 NTU)

Alternating deposit (< 80 NTU)

Sandy level (292 NTU)

# SMALL SCALE SEDIMENT VARIABILITY

Turbidity (NTU)

- **Relationship between sediment and hydro-sedimentary variables:**

**Attribution of one sediment facies according to a specific hydrodynamic behaviour:**

- Sandy levels correspond to the highest turbid flood events
- Alternating deposits correspond to small turbid flood event

➤ **Climate effects on the pluriannual scale (large scale) sedimentary variability of the Bruisseresse spring)**

**[Chédeville et al., 2016] HSJ**

# CLIMATE AND SEDIMENT RELATIONSHIP AT THE PLURIANNUAL SCALE

## ➤ Available data:

- Daily time series of :
  - Rainfalls (1981 => today)
  - Piezometry (since 1969)
  - Turbidity measured by the CODAH ( since the end 1987)
  
- Sedimentary filling on the same period (1988-2009)
  - Core made (C5)
  
- North Atlantic Oscillation climatic index (NAO), the most used on the region

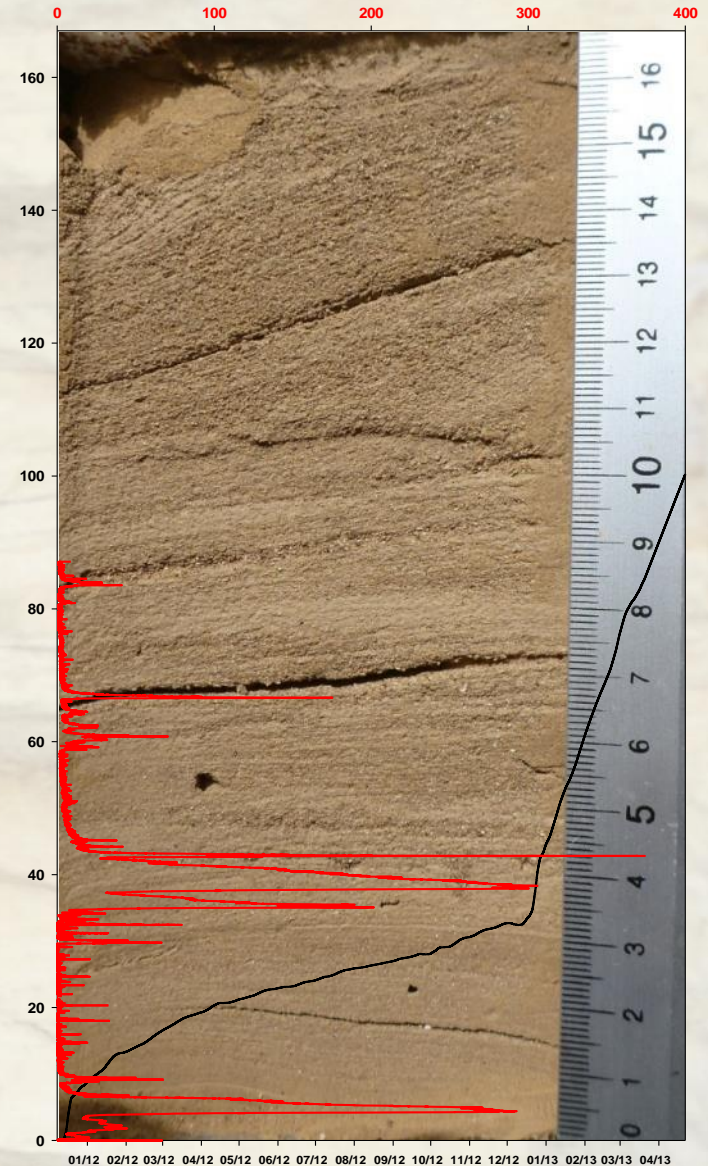

**Use of signal analysis tools => highlight the climate influence on the hydro-sedimentological variables**

# CLIMATE AND SEDIMENT RELATIONSHIP AT THE PLURIANNUAL SCALE

## ➤ Suspended sediment trap and hydro-sedimentary variables

Fixing the turbidity time serie with on the sediment filling from the previous results

# CLIMATE AND SEDIMENT RELATIONSHIP AT THE PLURIANNUAL SCALE

## ➤ From previous results: correlation between turbidity and core sediment

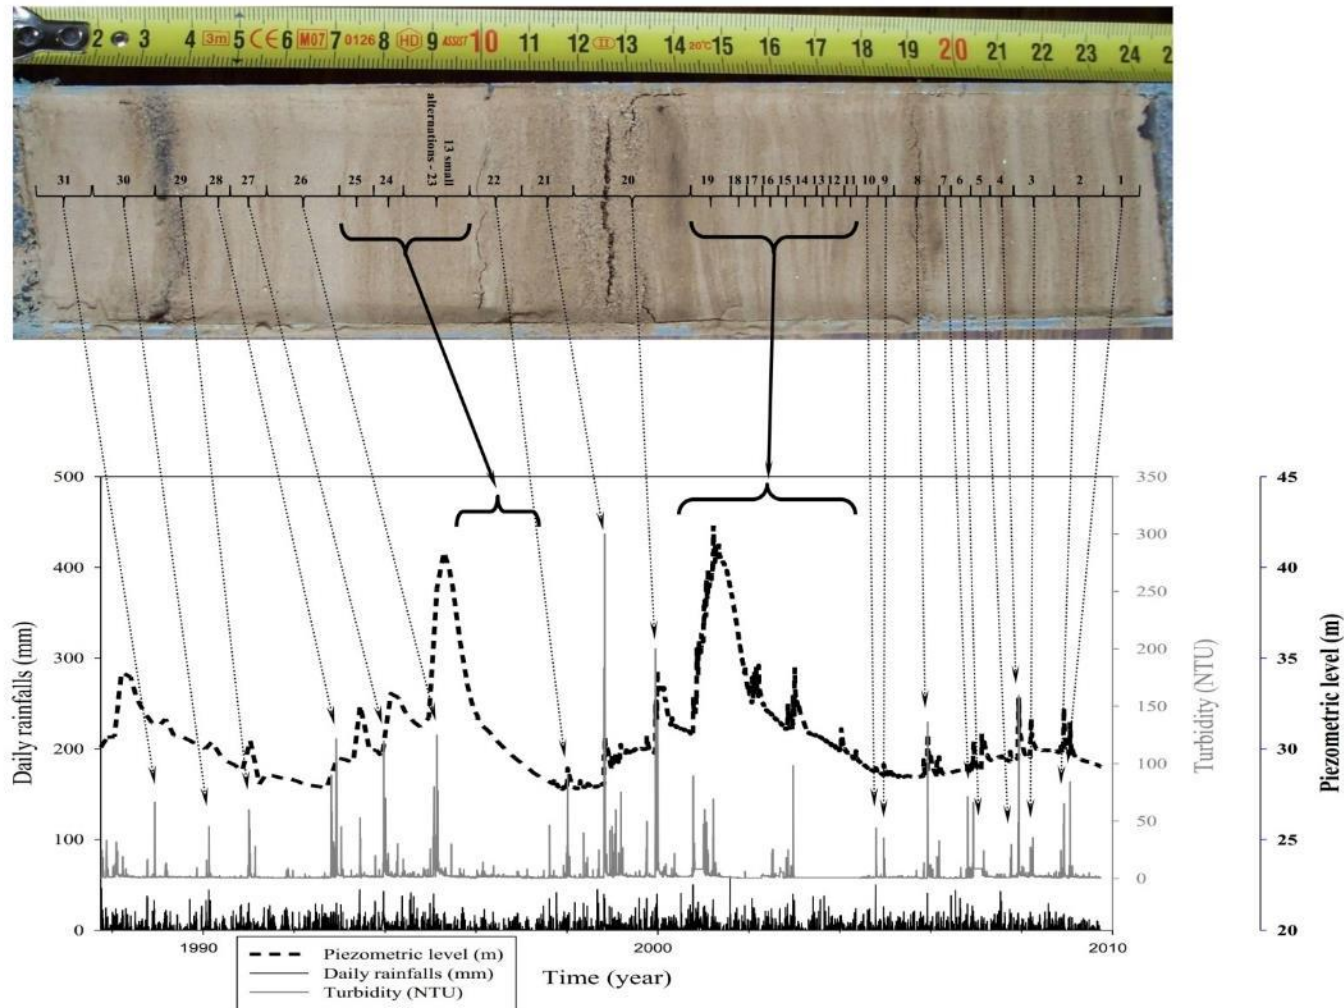

Figure 5: Coupling of hydrological and sedimentary data: adjustment of C5 core with turbidity (in Nephelometric Turbidity Unit) and piezometric level (above sea level)

Hanin, 2010 ; in Chédeville et al. 2016 (HSJ)

Small flood => alternating deposit (bright then dark)

Heavy flood => sandy level

# CLIMATE AND SEDIMENT RELATIONSHIP AT THE PLURIANNUAL SCALE

## ➤ Grey level core extraction

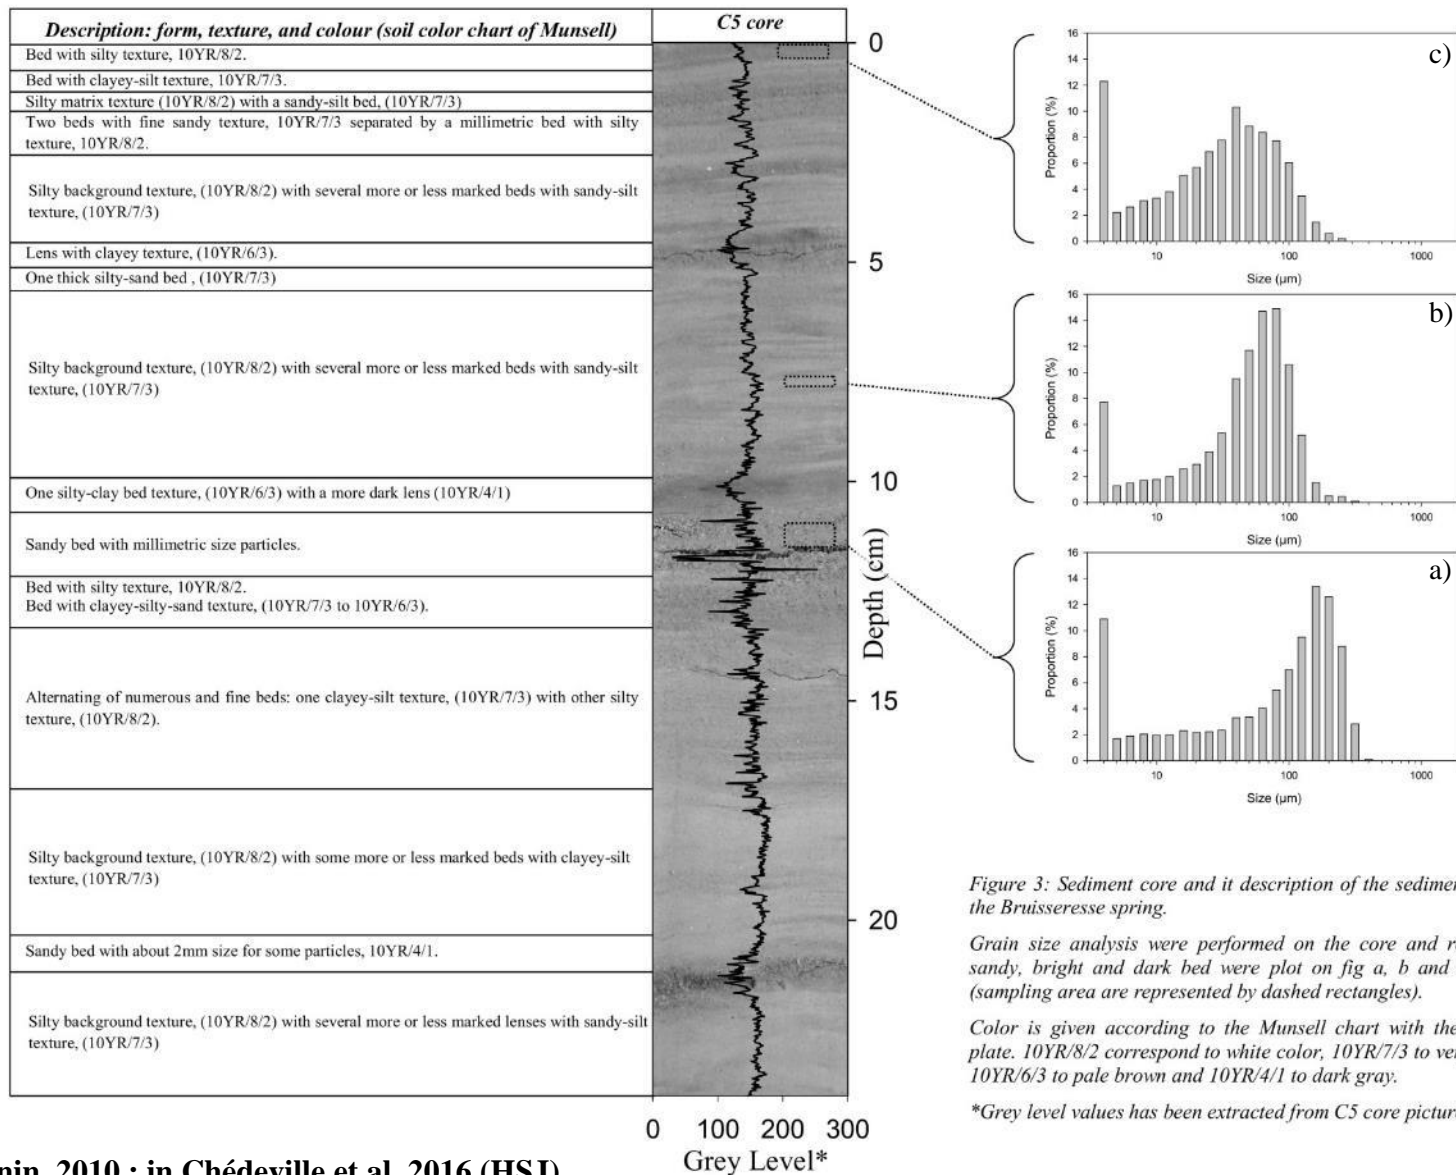

Figure 3: Sediment core and its description of the sedimentary filling of the Bruisseresse spring.

Grain size analysis was performed on the core and results for one sandy, bright and dark bed were plotted on fig a, b and c respectively (sampling areas are represented by dashed rectangles).

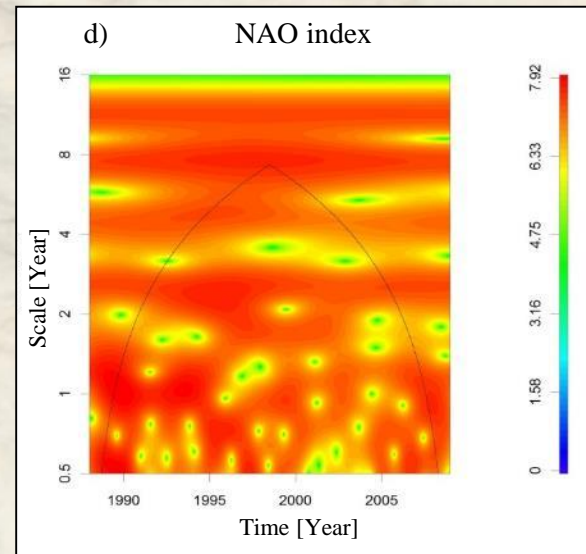

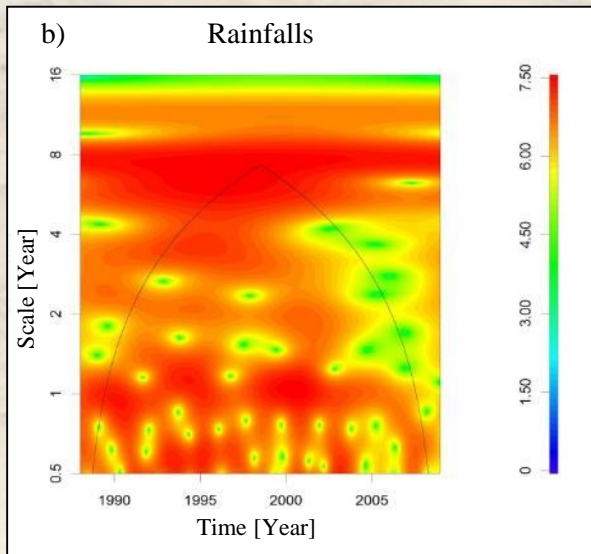

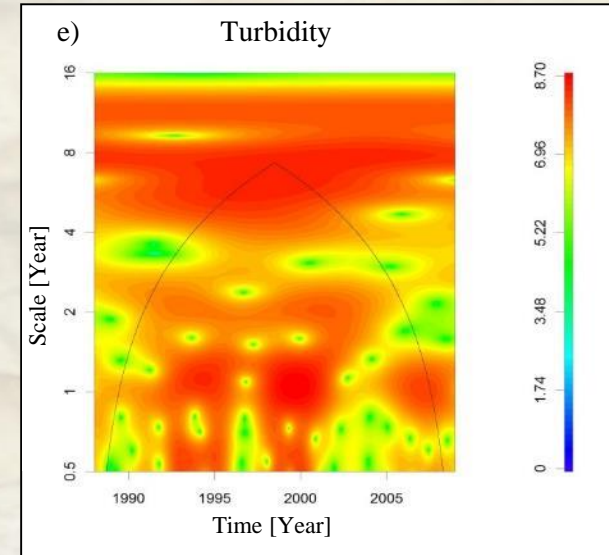

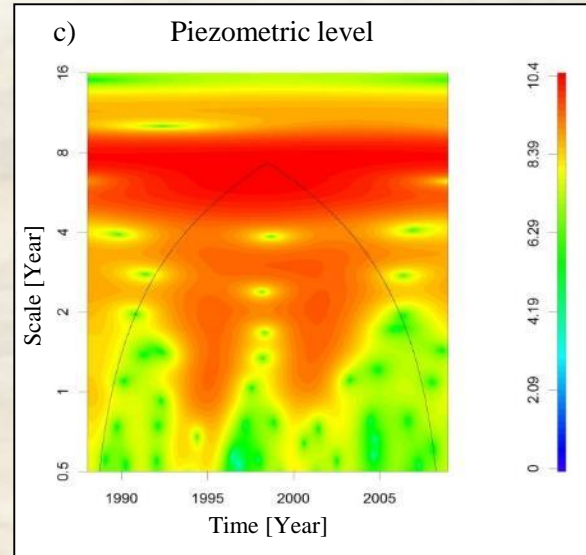

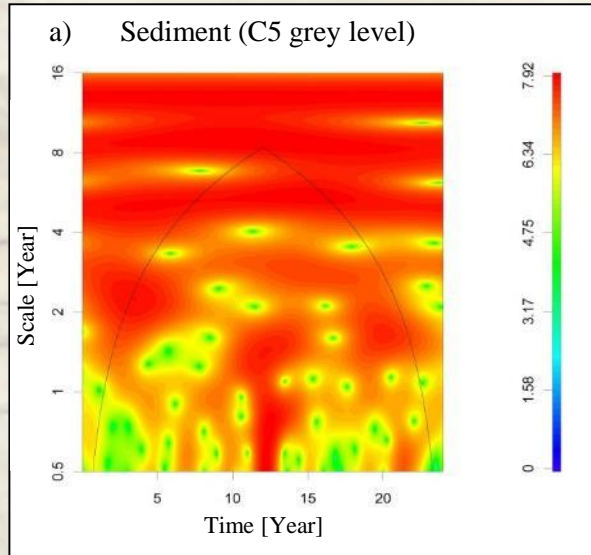

Color is given according to the Munsell chart with the use of 10YR plate. 10YR/8/2 corresponds to white color, 10YR/7/3 to very pale brown, 10YR/6/3 to pale brown and 10YR/4/1 to dark gray.

\*Grey level values have been extracted from C5 core picture

# CLIMATE AND SEDIMENT RELATIONSHIP AT THE PLURIANNUAL SCALE

## ➤ Wavelet analysis

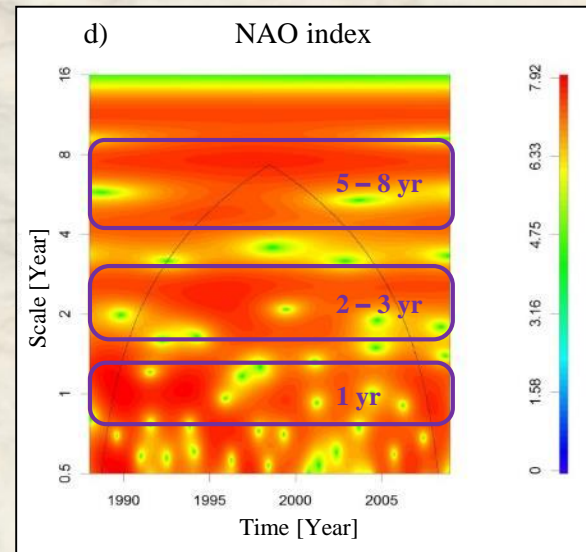

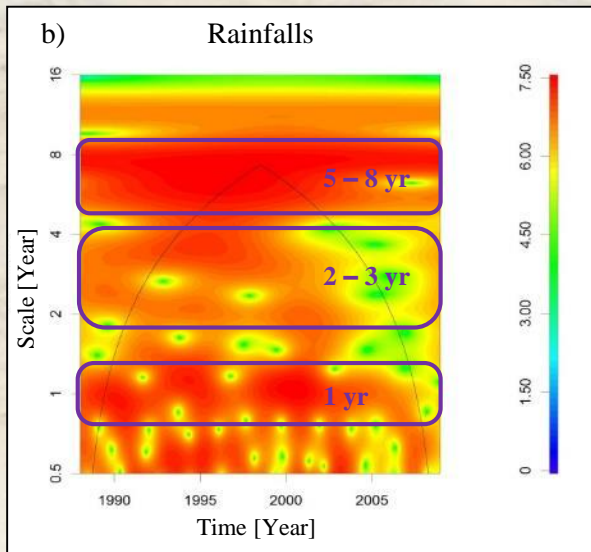

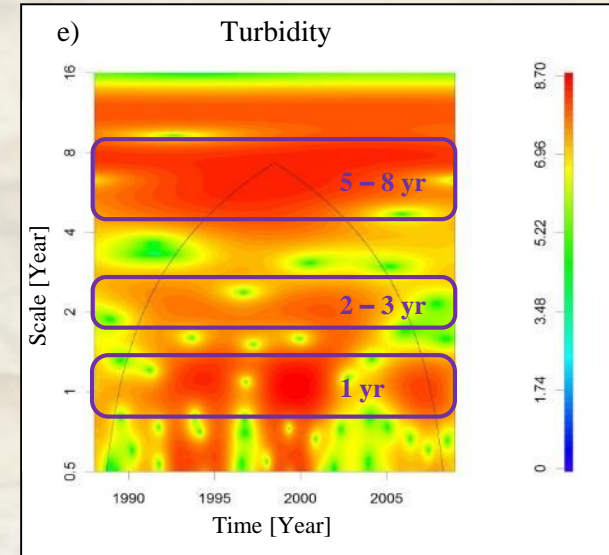

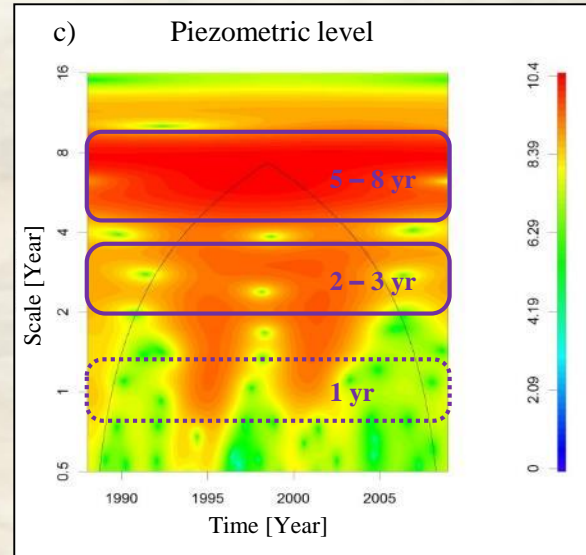

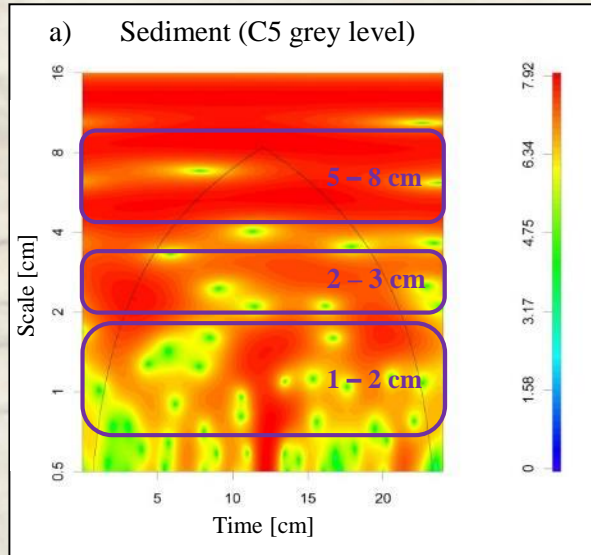

### Wavelet analysis:

- Time / frequency diagram
- Signal power on Z axis
- Power max=> Red
- Power min=> Blue
- Identification cycles and breaking cycles

# CLIMATE AND SEDIMENT RELATIONSHIP AT THE PLURIANNUAL SCALE

## ➤ Wavelet analysis

Rythmicities observed on whole spectra with following spectral bands:

- 5-8 yrs => Pluriannual band (NAO)
- 2-3 yrs => Quasi - biennial band (NAO)
- 1 yr => Hydrological cycle

# CONCLUSIONS

**Large scale (under climatic control with the NAO index) succession of:**

- Very wet periods with high turbid flood events

# CONCLUSIONS

**Large scale (under climatic control with the NAO index) succession of:**

- Very wet periods with high turbid flood events
- Few wet periods with numerous low turbid flood events

# CONCLUSIONS

**Large scale (under climatic control with the NAO index) succession of:**

- Very wet periods with high turbid flood events
- Few wet periods with numerous low turbid flood events
- 15-20 years period seem appear on the time serie with very high turbidity flood events and extrem turbidity flood events

**Thanks for  
your attention**
